I have a state called app. I render a list of users. Each user has an array called messages that consists of arrays with values like this: messages: [{message: 'Hello!'}, {message: 'It's ok!'}, {message: 'Hello'}] How can I get all the messages? I've tried: return (this.state.app.messages.map((message) => {message})) But it throws an error: undefined is not an object (evaluating 'message.message') A: Assuming messages are correct arrays (that is, each message is an array), you want map to return a new array where each entry is the concatenation of all the elements of the original array: messages: [{message: 'Hello!'}, {message: 'It's ok!'}, {message: 'Hello'}]; console.log(messages.map(message => message.map(x => x.message))); In a comment, you say that messages can also be an array of objects (instead of arrays of objects): messages: [{message: 'Hello!'}, {message: 'It's ok!'}, {message: 'Hello'}, // etc.]; In this case, map is a bit more complicated, as we need to know how to convert each object into an array: messages.map(function(message) { return message.message.split(','); }); If you know that all the messages are arrays, you can simplify things to the code in the question: messages.map(message => message.map(x => x.message))
