This utility contains two groups of utility, both can read and write on hard drive partition table and boot sector. The first group works in REAL DOS mode. It is very easy to use and it is designed to give back or restore hard drive partition table and boot sector to file. The partition table can be saved or restored only if the partition table is found in the first sector of the hard drive. If the partition table is not found, it will be ignored. If you are willing to restore the partition table to the first sector, you should read the description of the 'HDPT /D options' first. The other group works in booting MS DOS from hard drive. If you have got Windows operating system installed on the hard drive, the booting from the hard drive will be unsuccessful. The utility 'HDPT /R' can restore the partition table and the boot sector to file from a backup copy. The partition table and boot sector of the current hard drive can be restored to file for Windows operating system with the application program named "Restore partition table and boot sector from file". You should backup first the partition table and boot sector of the hard drive before you are trying to restore them from file. This utility can be also used to write the partition table to the hard drive if this option is used (see 'HDPT /P option'). The download site is: The driver must be read, installed and started by the computer operator. Open a DOS prompt and type "DISK /H:". This will display all the drives and partitions on the hard disk. Select a drive and type "DISK /S". A list of partitions will be displayed. Select one of the partitions and type "DISK /L". A list of items will be displayed. After the driver is installed and started, please reinstall the operating system. Thanks. Entropy-based evaluation of motion artifact and body-motion correction schemes in functional near-infrared spectroscopy. The entropy measure in combination with an information-theoretic classification of image frames has been used to evaluate the artifact-reducing capabilities of a general motion-correction scheme. The presented approach extends previous investigations by analyzing the entropy as a function of the number of frames per moving-averaging window and by comparing three different optimization algorithms, namely the sigma-gradient ascent (GAs), the simulated annealing (SA) and the conjugate-gradient (CG) algorithms. We show that GAs lead to spatially consistent motion compensation which can also be distinguished from the optimization schemes based on SA and CG. In addition, the evaluation algorithm does not rely on any particular underlying
